Remark

In this section, we consider the only gas which flows from left to right. Therefore, every velocity, momentum and Mach number are positive in this section. Moreover, we call the left and right of the nozzle the entry and exhaust section.
Isentropic Gas Flow through a Nozzle of (Slowly) Varying Cross Section $A(x)$

**Compressible Euler Equations:** The equations represent the motion of the inviscid and compressible gas through a nozzle.

$$
\begin{cases}
m' = -\frac{A'(x)}{A(x)} m, \\
\left(\frac{m^2}{\rho} + p(\rho)\right)' = -\frac{A'(x)}{A(x)} \frac{m^2}{\rho},
\end{cases}
\quad x \in \mathbb{R}, \quad ' = \frac{d}{dx}.
$$

- $\rho$: the density of the gas
- $\nu$: the velocity of the gas
- $m = \rho \nu$: the momentum of the gas
- $\gamma \in (1, 5/3]$: the adiabatic exponent\(^1\)
- $p(\rho) = \rho^\gamma / \gamma$: the pressure of the gas
- $A(x)$: the cross section\(^2\) of the nozzle at $x$

Mass Flow Conservation, the Bernoulli Equation

\[
\begin{align*}
\left\{ \begin{array}{l}
m' &= -\frac{A'(x)}{A(x)} m, \\
\left( \frac{m^2}{\rho} + p(\rho) \right)' &= -\frac{A'(x)}{A(x)} \frac{m^2}{\rho},
\end{array} \right. \quad x \in \mathbb{R}.
\end{align*}
\] (1.1)

From (1.1), we obtain
Mass Flow Conservation

\[ A(x)m = A(x)\rho v = C_1 \] (1.2)

and

Bernoulli Equation:

\[ \frac{v^2}{2} + \frac{\rho^{\gamma-1}}{\gamma - 1} = C_2. \] (1.3)
Mach Number, Supersonic, Sonic, Subsonic, Thrust

- $c := \sqrt{\rho'(\rho)} = \rho \frac{\gamma-1}{2}$: sonic speed (the speed of sound)
- $M := \frac{v}{c}$: Mach number
  - $M > 1$ supersonic $\Rightarrow$ The speed of gas is greater than that of sound.
  - $M = 1$ sonic $\Rightarrow$ The speed of gas is equal to that of sound.
  - $M < 1$ subsonic $\Rightarrow$ The speed of gas is lower than that of sound.

Thruster\(^1\) is the force that produced by an engine to push a plane and rocket forward.

Thruster $T = \text{the mass of the exhaust gas jetting per second}$ $A(x)\rho v \times \text{the velocity of the exhaust gas } v.$

$$T = A(x)\rho v^2 \quad (1.4)$$

Shape of the Rocket Engine

Question 1

Why does the exhaust port of the rocket engine have the convergent-divergent form?

Naoki Tsuge (Gifu University)
Internal Constitution of the Rocket Engine

oxygen (oxidizing agent) hydrogen (fuel)

combustion chamber
We assume that $A(x)$ satisfies the following.

$$
\begin{cases}
    A'(x) \leq 0, & x < 0, \\
    A'(x) \geq 0, & x \geq 0, \\
    A'(0) = 0.
\end{cases}
$$

(1.5)
If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the thrust (of the exhaust gas at the exhaust section) $T$ maximum.

From (1.2) and (1.3),

$$T = A(x)\rho v^2 = C_1 \sqrt{(\gamma - 1)C_2} \frac{1}{\sqrt{\frac{\gamma - 1}{2} + \frac{1}{M^2}}}$$

$\Rightarrow$ $T$ is the increasing function of $M$. 

If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the Mach number (of the exhaust gas at the exhaust section) $M$ maximum.
If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the thrust (of the exhaust gas at the exhaust section) $T$ maximum.

From (1.2) and (1.3),

$$T = A(x) \rho v^2 = C_1 \sqrt{(\gamma - 1) C_2} \frac{1}{\sqrt{\frac{\gamma - 1}{2} + \frac{1}{M^2}}}$$

(1.6)

$\Rightarrow T$ is the increasing function of $M$. 

If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the Mach number (of the exhaust gas at the exhaust section) $M$ maximum.
If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the thrust (of the exhaust gas at the exhaust section) $T$ maximum.

From (1.2) and (1.3),

$$T = A(x) \rho v^2 = C_1 \sqrt{(\gamma - 1)C_2} \frac{1}{\sqrt{\frac{\gamma - 1}{2} + \frac{1}{M^2}}}$$  

$\Rightarrow$ $T$ is the increasing function of $M$. 

If the Mach number of the exhaust gas at the entry section is lower than 1 (i.e. $M_0 < 1$), we want to make the Mach number (of the exhaust gas at the exhaust section) $M$ maximum.
Properties of $F(M)$

From (1.1), we obtain the following

$$(A(x)F(M))' = 0 \implies A(x)F(M) = A(x_0)F(M_0), \quad (1.7)$$

where

$$F(M) = M \left( \frac{\gamma+1}{2} \right)^{\frac{\gamma+1}{2(\gamma-1)}} \left( 1 + \frac{\gamma-1}{2} M^2 \right).$$

Properties of $F(M)$

- $F(0) = 0$, $F(1) = 1$.
- $F'(M) \geq 0$, $0 \leq M < 1$,
- $F'(M) \leq 0$, $M \geq 1$.
- $F(M) \to 0 \ (M \to \infty)$. 

Naoki Tsuge (Gifu University) 
Isentropic Gas Flow in a Laval Nozzle 
Japanese-German Workshop
Properties of $F(M)$

From (1.1), we obtain the following

$$(A(x)F(M))' = 0 \implies A(x)F(M) = A(x_0)F(M_0), \quad (1.7)$$

where

$$F(M) = M \left( \frac{\gamma + 1}{2} \right)^{\frac{\gamma + 1}{2(\gamma - 1)}} .$$

Properties of $F(M)$

- $F(0) = 0$, $F(1) = 1$.
- $F'(M) \geq 0$, $0 \leq M < 1$,
- $F'(M) \leq 0$, $M \geq 1$,
- $F(M) \to 0$ ($M \to \infty$).
Purpose
We investigate the increase and decrease of the Mach number $M$. 

Figure: Graph of $MF$
Purpose

We investigate the increase and decrease of the Mach number $M$.

Value of $M$ on $x > 0$

Figure: Graph of $MF$

$$F(M) = \frac{A(x_0)}{A(x)} F(M_0).$$
Critical Value of $M_0$

A solution only exists, if the following holds

$$\frac{A(x_0)}{A(0)} F(M_0) \leq 1.$$ 

Varying $M_0$, we consider the case where the equal sign is valid.

$$\frac{A(x_0)}{A(0)} F(\hat{M}_0) = 1.$$ 

We denote $M_0$ in this case by $\hat{M}_0$. We call $\hat{M}_0$ the **critical value** of the Mach number.
Graph of $F(M)$ on $x_0 \leq x \leq 0$ in the Case where $M_0$ is the Critical Value

\[ F(M) = \frac{A(x_0)}{A(x)} F(M_0). \]

Figure: Graph of $MF$
Bifurcation 2 (Subsonic-Supersonic Flow)

Figure: Graph of $xM$
By using the Laval nozzle, we can obtain the supersonic gas ($M > 1$) from the subsonic gas ($M < 1$). As a result, the gas has the maximal thrust at the exhaust section.

The Laval nozzle is essential for the rocket and the supersonic jet plane.
By using the Laval nozzle, we can obtain the supersonic gas \((M > 1)\) from the subsonic gas \((M < 1)\). As a result, the gas has the maximal thrust at the exhaust section. 

\[ \Rightarrow \] The Laval nozzle is essential for the rocket and the supersonic jet plane.

Question 2
Why is the speed of the solar wind so large near the orbit of the earth?
Spherically Symmetric Flow around the Sun

Figure: Spherical Symmetric Flow around the Sun
Spherical Symmetric Gas Flow with the Gravitational Source Term

We consider the isothermal case ($\gamma = 1$).

\[
\begin{align*}
  m' &= -\frac{2}{r} m, \\
  \left(\frac{m^2}{\rho} + \rho\right)' &= -\frac{2}{r} \frac{m^2}{\rho} - \frac{GM_s}{r^2} \rho, \quad r \geq r_0, \quad ' = \frac{d}{dr}. 
\end{align*}
\]

- $G$: the gravitational constant
- $M_s$: the mass of the sun
- $r$: the distance from the center of the sun

**Remark**

From $\rho(\rho) = \rho$, since $c = 1$, we find $v = M$. 

Comparison between Plasma and Laval Nozzle

From (1.8), we have the following.

\[(F_s(M)A_s(r))' = 0, \quad (1.9)\]

where

\[F_s(M) = Me^{-\frac{1}{2}M^2}, \quad A_s(r) = r^2 e^{\frac{GM_s}{r}}.\]

\(F_s(M)\) and \(A_s(r)\) satisfy the following.

\[
\begin{align*}
F_s'(M) &\geq 0, \quad 0 \leq M \leq 1, \\
F_s'(M) &\leq 0, \quad 1 < M, \\
F_s(0) &= 0, \\
F_s(M) &\to 0 \quad (M \to \infty),
\end{align*}
\]

\[
\begin{align*}
A_s'(r) &\leq 0, \quad r_0 \leq r < GM_s/2, \\
A_s'(r) &\geq 0, \quad r \geq GM_s/2, \\
A_s'(GM_s/2) &= 0.
\end{align*}
\]

(1.10)
Conclusion

(1.8) has the same structure as the Laval nozzle. Therefore, the motion of plasma is the same as that of the gas in the Laval nozzle. As a result, the plasma can be supersonic.

Isentropic Gas Flow through a Nozzle of (Slowly) Varying Cross Section $A(x)$

\[
\begin{cases}
\rho_t + m_x = a(x)m, \\
m_t + \left( \frac{m^2}{\rho} + p(\rho) \right)_x = a(x) \frac{m^2}{\rho},
\end{cases}
\quad x \in \mathbb{R}.
\tag{2.1}
\]

- \(\rho\): the density of gas
- \(v\): the velocity of gas
- \(m = \rho v\): the momentum of gas
- \(\gamma \in (1, 5/3]\): the adiabatic exponent
- \(p(\rho) = \rho^\gamma / \gamma\): the pressure of gas
- \(a(x) = -A'(x)/A(x), \quad A(x): the cross section of the nozzle at x\)
For simplicity, we denote (2.1) by
\[
\frac{\partial u}{\partial t} + f(u)\frac{\partial}{\partial x} = g(x, u), \quad u = \begin{pmatrix} \rho \\ m \end{pmatrix}.
\]  
(2.1)
Then, we consider the Cauchy problem (2.1) with initial data
\[
\left. u \right|_{t=0} = u_0(x) = (\rho_0(x), m_0(x)).
\]  
(2.2)
Riemann Invariants

We define Riemann invariants by

\[ z = v - \frac{\rho}{\theta}, \quad w = v + \frac{\rho}{\theta}, \quad \theta = \frac{\gamma - 1}{2}. \]  \hspace{1cm} (2.3)

Properties of Riemann Invariants

- If \( v \geq 0 \), \( |w| \geq |z| \) and \( w \geq 0 \).
- If \( v \leq 0 \), \( |w| \leq |z| \) and \( z \leq 0 \).
- \( z \) is bounded from below and \( w \) is bounded from above. \( \iff \rho \) and \( v \) are bounded.

Diagonalization, Characteristic Speed

One-dimensional Euler equations (i.e., $A'(x) = 0$):

\[
\begin{align*}
\rho_t + m_x &= 0, \\
m_t + \left( \frac{m^2}{\rho} + p(\rho) \right)_x &= 0, \\
\end{align*}
\]  

$x \in \mathbb{R}$.  

(2.4)

If (2.4) has a smooth solution, we can diagonalize (2.4) into

\[
\begin{align*}
z_t + \lambda_1 z_x &= 0, \\
w_t + \lambda_2 w_x &= 0,
\end{align*}
\]

(2.5)

where $\lambda_1$ and $\lambda_2$ are characteristic speeds defined by

$$
\lambda_1 = v - \rho^\theta, \quad \lambda_2 = v + \rho^\theta.
$$
Existence of Invariant Regions

Theorem 1 (by Chueh, K. N., Conley, C. C., Smoller, J. A. in 1977)

For any fixed $C_1, C_2 > 0$, if initial data $u_0(x)$ are contained the region $\Delta = \{(\rho, v) \in \mathbb{R}^2; \rho \geq 0, z \geq -C_1, w \leq C_2\}$, solutions to the Cauchy problem of (2.4) are also contained in $\Delta$. 
Existence of Solutions for One-dimensional Case (2.4)

If \( \rho_0, v_0 \in L^\infty(\mathbb{R}) \), the Cauchy problem of (2.4) has a weak solution.

Outline of the proof

1. We deduce from Theorem 1 the \( L^\infty \) estimate of approximate solutions (constructed by difference schemes and vanishing viscosity methods).
2. We deduce from the compactness of approximate solutions.
3. From compensated compactness, we derive the convergence of approximate solutions.

**Remark 1**

The invariant region for the nozzle flow (2.1) has not yet been obtained.

Laval Nozzle

We hereafter consider the following Laval nozzle
\( A'(x) \leq 0, \ x \leq 0, \ A'(x) \geq 0, \ x \geq 0 \).

Figure: Laval nozzle
Main Theorem

Theorem 3 (published in ARMA)

For any fixed $M > 0$, if initial data satisfy

$$-M\{A_-(x)\}^{-\frac{\gamma-1}{\gamma+1}} \leq z(u_0(x)), \quad w(u_0(x)) \leq M\{A_+(x)\}^{-\frac{\gamma-1}{\gamma+1}},$$

$$0 \leq \rho_0(x),$$

the Cauchy problem (2.1)–(2.2) has a weak entropy solution, where

$$A_-(x) = \begin{cases} A(x), & x \geq 0, \\ A(0), & x < 0, \end{cases} \quad A_+(x) = \begin{cases} A(0), & x \geq 0, \\ A(x), & x < 0. \end{cases}$$
Remark for Theorem 3

1. If $A(x)$ is uniformly bounded, the condition (2.6) implies that we can give arbitrary $L^\infty$ data, $\rho_0, v_0 \in L^\infty(\mathbb{R})$.

2. Our theorem contains sonic state, subsonic-supersonic flow.

3. Solutions $u(x, t)$ of Theorem 3 satisfy

$$- M\{A_-(x)\}-\frac{\gamma-1}{\gamma+1} \leq z(u(x, t)), \quad w(u(x, t)) \leq M\{A_+(x)\}-\frac{\gamma-1}{\gamma+1},$$

$$0 \leq \rho(x, t).$$

That is, the region

$$\Delta_x = \{(z, w); \rho \geq 0, -M\{A_-(x)\}-\frac{\gamma-1}{\gamma+1} \leq z, \quad w \leq M\{A_+(x)\}-\frac{\gamma-1}{\gamma+1}\}$$

is the invariant region for the Cauchy problem (2.1)–(2.2).
Invariant Region $\Delta_x$

   - Recent Result for General Nozzle
Diagonalization of (2.1)

If (2.1) has a smooth solution, we can diagonalize (2.1) into

\[
\begin{align*}
z_t + \lambda_1 z_x &= -a(x)\rho^\theta v, \\
w_t + \lambda_2 w_x &= a(x)\rho^\theta v.
\end{align*}
\]

For symmetry, we consider the only case where \( x \geq 0 \). Then, we notice that \( a(x) \leq 0 \).

Effect of inhomogeneous term of (2.7)

- If \( v \) is positive, the inhomogeneous term makes \( z \) increase and \( w \) decrease in \( t \).
- If \( v \) is negative, the inhomogeneous term makes \( z \) increase and \( w \) decrease in \( t \).
Riemann Invariants

We define Riemann invariants by

\[ z = v - \frac{\rho^\theta}{\theta}, \quad w = v + \frac{\rho^\theta}{\theta}, \quad \theta = \frac{\gamma - 1}{2}. \]  \hspace{1cm} (2.3)

Properties of Riemann Invariants

- \( z \) is bonded from below and \( w \) is bounded from above. \( \iff \) \( \rho \) and \( v \) are bounded.
- If \( v \geq 0 \), \( |w| \geq |z| \) and \( w \geq 0 \).
- If \( v \leq 0 \), \( |w| \leq |z| \) and \( z \leq 0 \).
- \( v = \frac{w + z}{2} \).
Diagonalization of (2.1)

If (2.1) has a smooth solution, we can diagonalize (2.1) into

\[ z_t + \lambda_1 z_x = -a(x)\rho^\theta v, \]
\[ w_t + \lambda_2 w_x = a(x)\rho^\theta v. \]  

(2.7)

For symmetry, we consider the only case where \( x \geq 0 \). Then, we notice that \( a(x) \leq 0 \).

Effect of inhomogeneous term of (2.7)

- If \( v \) is positive, inhomogeneous term makes \( z \) increase and \( w \) decrease in \( t \).
- If \( v \) is negative, inhomogeneous term makes \( z \) increase and \( w \) decrease in \( t \).

Most Difficult Point

The bounded estimate of \( z \) from below in the case where \( v \) is negative.
Transformation of (2.7)

We set \( \tilde{z} = \{A(x)\}^{\frac{\gamma-1}{\gamma+1}} z \). From (2.6)\(_1\), we find \(-M \leq \tilde{z}_0(x)\).
Moreover, from (2.7)\(_1\), we have

\[
\tilde{z}_t + \lambda_1(u)\tilde{z}_x = -\frac{\gamma - 1}{\gamma + 1} a(x) \{A(x)\}^{\frac{\gamma-1}{\gamma+1}} \left( (v)^2 + \left(\frac{\rho}{\theta}\right)^{2\theta} \right). \tag{2.8}
\]

Remark 2

The inhomogeneous term of (2.8) is nonnegative.

Set \( \tilde{w} = \{A(0)\}^{\frac{\gamma-1}{\gamma+1}} w \). From (2.6)\(_2\), we find \( \tilde{w}_0(x) \leq M \).
Moreover, from (2.7)\(_2\), we have

\[
\tilde{w}_t + \lambda_2 \tilde{w}_x = a(x) \{A(0)\}^{\frac{\gamma-1}{\gamma+1}} \rho^\theta v = a(x) \{A(0)\}^{\frac{\gamma-1}{\gamma+1}} \rho^\theta \frac{w + z}{2}. \tag{2.9}
\]
Outline of the Proof

We formally prove that $\Delta x$ is an invariant region, that is, for any fixed $M > 0$, initial data satisfy

$$-M\{A_-(x)\}^{-\frac{\gamma-1}{\gamma+1}} \leq z_0(x), \quad w_0(x) \leq M\{A_+(x)\}^{-\frac{\gamma-1}{\gamma+1}},$$

solutions to the Cauchy problem (2.1)–(2.2)

$$-M\{A_- (x)\}^{-\frac{\gamma-1}{\gamma+1}} \leq z(x,t), \quad w(x,t) \leq M\{A_+(x)\}^{-\frac{\gamma-1}{\gamma+1}}, \quad (2.10)$$

where

$$A_-(x) = \begin{cases} A(x), & x \geq 0, \\ A(0), & x < 0, \end{cases} \quad A_+(x) = \begin{cases} A(0), & x \geq 0, \\ A(x), & x < 0. \end{cases}$$
We set $\tilde{z} = \{A_-(x)\} \frac{\gamma-1}{\gamma+1} z$, $\tilde{w} = \{A_+(x)\} \frac{\gamma-1}{\gamma+1} w$. We prove the following. If

$$-M \leq \tilde{z}_0(x), \quad \tilde{w}_0(x) \leq M,$$

$$-M \leq \tilde{z}(x, t), \quad \tilde{w}(x, t) \leq M.$$ 

For any positive constant $\varepsilon$ and $T$, we set

$$\tilde{z}(x, t) = \tilde{z}(x, t) + \frac{\varepsilon}{T - t}, \quad \tilde{w}(x, t) = \tilde{w}(x, t) - \frac{\varepsilon}{T - t}.$$

Then we find

$$-M < \tilde{z}_0(x), \quad \tilde{w}_0(x) < M.$$
We assume $\tilde{z}(x,t)$ and $\tilde{w}(x,t)$ have compact supports on $0 \leq t < T$. Then, on $0 \leq t < T$, we shall prove

$$-M < \tilde{z}(x,t), \quad \tilde{w}(x,t) < M.$$ 

At a point $x = x_*, t = t_*$ ($t_* < T$), if

$$-M = \tilde{z}(x_*, t_*), \quad -M < \tilde{z}(x,t), \quad \tilde{w}(x,t) < M, \quad 0 \leq t < t_* \quad (2.11)$$

or

$$\tilde{w}(x_*, t_*) = M, \quad -M < \tilde{z}(x,t), \quad \tilde{w}(x,t) < M, \quad 0 \leq t < t_* \quad (2.12)$$

hold, we shall deduce a contradiction.

We hereafter consider the only case where $x_* \geq 0$. We can similarly treat with the case where $x_* < 0$.

Isentropic Gas Flow in a Laval Nozzle  
Japanese-German Workshop 68 / 76
The Case where (2.11) Holds

Then, since $\ddot{z}$ attains the minimum at $x = x^*_t$, $t = t^*_t$, we find $\ddot{z}_t \leq 0$, $\ddot{z}_x = 0$.

On the other hand, from

$$\ddot{z}_t + \lambda_1(u)\ddot{z}_x = -\frac{\gamma - 1}{\gamma + 1} a(x) \left\{ A(x) \right\}^{\frac{\gamma - 1}{\gamma + 1}} \left( (v)^2 + \frac{(\rho)^{2\theta}}{\theta} \right)$$

(2.9)

and $\ddot{z}(x, t) = \ddot{z}(x, t) + \varepsilon/(T - t)$, at $x = x^*_t$, $t = t^*_t$ we have

$$\ddot{z}_t + \lambda_1(u)\ddot{z}_x = -\frac{\gamma - 1}{\gamma + 1} a(x) \left\{ A(x) \right\}^{\frac{\gamma - 1}{\gamma + 1}} \left( (v)^2 + \frac{(\rho)^{2\theta}}{\theta} \right) + \frac{\varepsilon}{(T - t)^2} > 0.$$

This is a contradiction.
The Case where (2.12) Holds

Then, $\dot{w}$ attains the maximum at $x = x_*, t = t_*$, we find $\dot{w}_t \geq 0$, $\dot{w}_x = 0$. On the other hand, at $x = x_*, t = t_*$, we notice that

$$w + z = \{A(0)\} - \frac{\gamma - 1}{\gamma + 1} \dot{w} + \{A(x_*)\} - \frac{\gamma - 1}{\gamma + 1} \dot{z}$$

$$= \{A(0)\} - \frac{\gamma - 1}{\gamma + 1} \left(\dot{w} + \frac{\varepsilon}{T - t}\right) + \{A(x_*)\} - \frac{\gamma - 1}{\gamma + 1} \left(\dot{z} - \frac{\varepsilon}{T - t}\right)$$

$$\geq \left(M + \frac{\varepsilon}{T - t}\right) \left[\{A(0)\} - \frac{\gamma - 1}{\gamma + 1} - \{A(x_*)\} - \frac{\gamma - 1}{\gamma + 1}\right] \geq 0.$$
Then, from
\[ \tilde{\nu}_t + \lambda_2 \tilde{\nu}_x = a(x) \{ A(0) \}^{\gamma-1 \gamma+1} \rho^\theta \frac{w + z}{2} \]  
(2.10)

and \( \tilde{\nu}(x, t) = \tilde{\nu}(x, t) - \varepsilon/(T - t) \), we have
\[ \tilde{\nu}_t + \lambda_2 \tilde{\nu}_x = a(x) \{ A(0) \}^{\gamma-1 \gamma+1} \rho^\theta \frac{w + z}{2} - \frac{\varepsilon}{(T - t)^2} < 0. \]

This is a contradiction.
Since \( \varepsilon \) and \( T \) are arbitrary, we can prove (2.10).

3. Appendix
   - Recent Result for General Nozzle
In this section, we consider a general nozzle. We choose positive constants $M, \sigma$ and nonnegative function $b \in C^1(\mathbb{R})$ such that

$$\|b\|_{L^1} \ll M \ll 1.$$  (3.1)
Main Theorem 2

Theorem 4 (to appear in ARMA)

For $M$ and $b$ in (3.1), we assume that initial data $u_0 = (\rho_0, m_0) \in L^\infty(\mathbb{R})$ satisfy

\[
0 \leq \rho_0(x), \quad -M - \int_x^\infty b(y)dy \leq z(u_0(x)),
\]

\[
w(u_0(x)) \leq M + \int_{-\infty}^x b(y)dy.
\]

(3.2)

Then the Cauchy problem (2.1)–(2.2) has a weak entropy solution.

Remark 3

The solution of Theorem 4 satisfy the same inequality as (3.2).
